

## Front-End wireframe #4

*Design a simple and understandable wireframe for the front-end of the web interface that will be used by administrators and staff to interact with the access monitoring system. The wireframe should provide a visual guide with key elements for the development of the front-end.*

The front-end of the access monitoring system is designed to be extremely simple, user-friendly and intuitive, catering to both administrators and staff.

The interface will consist of key functional pages including a Login Page, User Registration and Access Logs page. Each page is carefully structured to ensure ease of use and efficient navigation. The design will feature a consistent navigation bar, clean and simple forms, and clearly labeled buttons to guide users through their tasks.

The User Registration page will integrate seamlessly with the fingerprint scanning process. This page will require Administrative permission in order to access it. The Access Logs page will offer comprehensive tools for managing user data and monitoring lab entries and exits.

This front-end design aims to provide a smooth and efficient user experience, ensuring that all system interactions are straightforward and accessible.
